# Processing a Digital Image – Revision 11.10 Best Practices

1. Transfer original JPEG (.jpg) or RAW camera file to hard drive of your choice via USB or Firewire – directly from the camera or with a card reader.

- 2. Sort, Select and Process (if shooting RAW) within Adobe Bridge
- 3. Open JPEGs requiring adjustment in Adobe Photoshop.
  - 3a. Duplicate background layer
  - 3b. Apply all corrections/modifications as "adjustment layers"

Luminance – Levels Color – Curves Grayscale – Channel Mixer Sharpening – Unsharp Mask applied to Duplicate Background Layer

4. Saving Working copy of file as Photoshop File Format (.PSD) or .TIFF (without compression, or maintaining layers)

# Preparing the working copy for Print

Color working space should be configured to **Adobe RGB 1998** / **Pro Photo RGB (?)** prior to opening files for print.

1. Open working copy of the file and apply any adjustments required prior to scaling resolution to appropriate dimension for the final print (as described above).

2. Convert Resolution to appropriate print dimensions with **Resample OFF Photoshop Menu -> Image -> Image Size** 

# **Print Dimension Recommendations:**

8.5X11 Sheet with Narrow Margin – 10.75 on the largest dimension/height or width

8.5X11 Sheet with No Margin – Borderless – 11 (requires borderless sheet feeder selection in Page Setup)

8.5X11 Sheet with Larger Margin for Mount/Matting – 9.5 on the largest dimension

**Sharpening** – Unsharp mask applied as final step prior to printing (\*Unsharp Mask applied to Duplicate Background Layer)

Depending on the size and complexity of the file an optional final step prior to sending to printer is to flatten all layers. (\*Do not overwrite your working file in the flattened state!)

# 3. Adobe Photoshop File Menu - Select Print

# 4. Click on **Print Settings** – Select **Printer**, **Presets** are **Standard**, and **Paper Size**.

O Untitled1		
Print		
Printer: EPSON Stylus Photo R1900 Presets: Standard Paper Size: US Letter Print Settings Basic Advanced Color Settings Page Setup: Standard \$		
Media Type: Premium Photo Paper Glossy		
Color: Color 16 bit/Channel		
Color Settings: EPSON Vivid		
Print Quality: Photo		
✓ High Speed   On		
? PDF Preview Supplies Cancel Save		

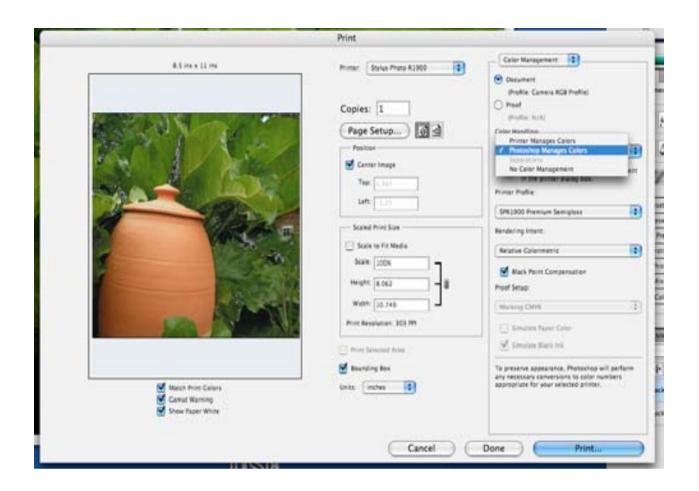

#### **Print Settings**

- Media Type set the appropriate paper surface or media type.
- Color Ink Use Color or Black only \*grayscale
- Color Settings OFF (No Color Adjustment)
- Print Quality \*should be resolution:

Photo (1440x720) Best Photo (1440x1440) Photo RPM (5769x1440)

- High Speed ON
- Gloss Optimizer ON/OFF (\*optional)

Select **Save**. Return to Printing with Preview menu

7. Color Management menu (\*right hand column)

# Let Photoshop Determine Colors

8. Printer Profile Selection - choose Profile for specific printer and paper.

The primary difference with regard to an Epson print using a printer profile is the selection, installation and application of a paper profile specific to the paper and printer combination. In the initial color management menu under Print select the Printer Profile provided by the manufacturer of the paper you have chosen for this specific printer. All other color management systems and options will be turned off in a later menu.

# 9. Rendering Intent – Relative Colormetric,

A **rendering intent** determines how a color management system handles color conversion from one color space to another. Different rendering intents use different rules to determine how the source colors are adjusted; for example, colors that fall inside the destination gamut may remain unchanged, or they may be adjusted to preserve the original range of visual relationships when translated to a smaller destination gamut. The result of choosing a rendering intent depends on the graphical content of documents and on the profiles used to specify color spaces. Some profiles produce identical results for different rendering intents.

**Perceptual** Aims to preserve the visual relationship between colors so it's perceived as natural to the human eye, even though the color values themselves may change. This intent is suitable for photographic images with lots of out-of-gamut colors. This is the standard rendering intent for the Japanese printing industry.

**Saturation** Tries to produce vivid colors in an image at the expense of color accuracy. This rendering intent is suitable for business graphics like graphs or charts, where bright saturated colors are more important than the exact relationship between colors.

**Relative Colorimetric** Compares the extreme highlight of the source color space to that of the destination color space and shifts all colors accordingly. Out-of-gamut colors are shifted to the closest reproducible color in the destination color space. Relative colorimetric preserves more of the original colors in an image than Perceptual. This is the standard rendering intent for printing in North America and Europe

**Absolute Colorimetric** Leaves colors that fall inside the destination gamut unchanged. Out of gamut colors are clipped. No scaling of colors to destination white point is performed. This intent aims to maintain color accuracy at the expense of preserving relationships between colors and is suitable for proofing to simulate the output of a particular device. This intent is particularly useful for previewing how paper color affects printed colors.

### 10. Black point compensation – checked

**Black Point Compensation** Ensures that the shadow detail in the image is preserved by simulating the full dynamic range of the output device. Select this option if you plan to use black point compensation when printing (which is recommended in most situations).

#### 11. Select Print – Load Paper / face up
